

DEMO TASK — AI PRODUCT (UI/UX) DESIGNER

Objective

Design a **production-grade product experience**.

You can choose **ONE** of the following tracks:

- **Track A (Advanced)** → Native app builder (AI product, high ambiguity)

Reference - <https://www.levels.fyi/> <https://www.ambitionbox.com/> <http://glassdoor.co.in/>
<https://6figr.com/>

- **Track B (Structured)** → Content-driven marketplace (college discovery, reviews, insights)

Reference - <https://collegedunia.com/> <https://www.careers360.com/>, [CollegeDekho](http://CollegeDekho.com) ,
<https://www.shiksha.com/>,

Both are evaluated at a **top 1% bar**.

Choose where you can demonstrate your **strongest thinking**.

Design Task: Build the Coolest Compensation Product (2026)

Context

Products like Levels.fyi, Glassdoor, and AmbitionBox have made salary data accessible.

But they all share a problem:

They are **functional**, but not **delightful**. **Informative**, but not **aspirational**.
Useful, but not “cool.”

Your Challenge

Design a **next-generation compensation platform** that feels like it was built in **April 2026**, not 2018.

Think:

- Would a **top-tier engineer / PM / designer** actually *enjoy using this*?
- Would someone **share this product with friends**?
- Does it feel like a **product**, or just a database?

👉 Your goal:

Make compensation exploration addictive, insightful, and visually exceptional.

Step 1: Market Scan (Don't Skip)

Explore existing players:

- Levels.fyi
- Glassdoor
- AmbitionBox
- Blind

Analyze:

- Where do they feel **boring / outdated**?
 - Where do they **overwhelm users with data**?
 - Where do they **fail in trust, clarity, or engagement**?
-

Step 2: Define Your Point of View

Be opinionated:

- Who is your **primary user**?
 - Early career?
 - Job switchers?
 - High-performers optimizing comp?
- What is your **core wedge**?
 - Exploration?
 - Comparison?

- Decision-making?
- Social validation?

👉 Write this clearly. This drives everything.

Step 3: Design the Product (Make It COOL)

This is the most important part.

Your design should feel:

- **Fast**
- **Modern**
- **Interactive**
- **Premium**
- **Sharable**

Think beyond static UI:

- Micro-interactions
 - Smart defaults
 - Visual storytelling
 - Smooth navigation
-

Required Screens

Design at least:

- Homepage (wow factor + clarity)
 - Salary discovery experience
 - Company page
 - Compensation breakdown (must be best-in-class)
 - Comparison view (this is critical)
 - Contribution / submission flow
-

Step 4: Rethink Data Experience

This is where most candidates fail.

Don't just show data—**design meaning**:

- What matters most in compensation?
- How do you reduce noise?
- How do you make comparisons intuitive?

Examples:

- Salary vs cost of living
- Offer benchmarking
- Career trajectory insights

👉 Show **tables, charts, or visual layers**, but keep it simple.

Mobile + Web

- Mobile ≠ compressed desktop
 - Show **real UX differences**
 - What becomes swipeable? What becomes visual-first?
-

Step 5: Make It 10x Better

You are expected to **push the product forward**, not polish it.

Ideas (optional direction):

- AI-assisted salary insights
 - Personalized dashboards
 - “What should I earn?” estimators
 - Social proof layers (anonymous but credible)
 - Career path simulation
-

Deliverables

1. Figma (Mandatory)

- Live link
- Clean flows + components

2. 1-Page Writeup

Cover:

- Your vision
 - What makes this product “cool”
 - Key product decisions
 - What you improved vs existing tools
-

Evaluation Criteria

We are looking for:

- **Taste** → Does it feel premium?
 - **Product thinking** → Clear POV, not generic
 - **UX clarity** → Easy to use despite complexity
 - **Data design** → Signal > noise
 - **Execution** → Clean, consistent, thoughtful
-

Avoid

- Copying existing UI
 - Overcomplicated dashboards
 - Dribbble-only aesthetics (no depth)
 - Generic “AI-powered” claims without UX
-

Final Thought

The bar is simple:

If this product launched today, would people say

“Damn, this is way better than anything out there”?

Here’s a **refined, high-bar version of Track B**—aligned with your expectation:
not just usable, but one of the coolest consumer + content products in this category.

TRACK B — Build the Coolest College Discovery Platform (2026)

Context

Platforms like

- Collegedunia
- CollegeDekho
- Shiksha

solve a real problem: helping students discover and choose colleges.

But the reality:

These products feel **outdated, cluttered, SEO-heavy, and low-trust**
They optimize for traffic, not **decision-making**

Your Challenge

Design a **next-generation college discovery platform** that feels like it was built in **April 2026**.

👉 Your goal is NOT to replicate

👉 Your goal is to **reimagine + dramatically improve**

Think:

- Would a student actually **trust this product for life decisions**?
 - Does it reduce **confusion** → **clarity**?
 - Does it feel like a **modern product**, not a content farm?
-

Step 1: Deep Research (Non-Negotiable)

Audit existing platforms:

- Collegedunia
- CollegeDekho
- Shiksha

Identify:

- Where UX is **broken or overwhelming**
- Where content feels **spammy / biased**
- Where users **lose confidence**
- Gaps in **decision-making support**

👉 Don't describe. Diagnose.

Step 2: Define Your POV

Be sharp and opinionated:

- Who is your **primary user**?
 - Tier 2/3 aspirants?
 - High-intent exam qualifiers?
 - Parents?
 - What is your **core job-to-be-done**?
 - Discovery?
 - Comparison?
 - Final decision?
 - What is your **product philosophy**?
 - Clarity-first?
 - Trust-first?
 - Data-first?
 - Mobile-first?
-

Step 3: Design the Product (Make It World-Class)

Your product should feel:

- **Clean (not cluttered)**
 - **Fast (not heavy SEO pages)**
 - **Trustworthy (not affiliate-driven)**
 - **Modern (not 2010 UI)**
 - **Delightful (students enjoy using it)**
-

What You MUST Design

1. Search & Discovery (Critical Entry Point)

Design:

- Course-first OR goal-first discovery
- Smart filters (fees, location, exams, placements)
- Ranking logic (not just lists)

 Make discovery feel **guided, not overwhelming**

2. College Detail Page (CORE)

This is the **most important screen**

Design:

- Overview:
 - Fees
 - Placements
 - Rankings
 - ROI (very important)
- Courses & admissions
- Infrastructure / campus insights

 This page should answer:
“Should I choose this college or not?”

3. Review & Rating System (DEEP)

Most platforms fail here. You shouldn't.

Design:

- Review submission flow
- Structured inputs:
 - Ratings (placements, faculty, campus)
 - Pros / cons
 - Tags (hostel, crowd, academics)
- Trust layer:

- Verified student badges
- Review credibility signals
- Anti-spam UX

👉 Focus on:

Trust > volume

4. 🧠 Content Layer (DIFFERENTIATOR)

Design:

- Guides (exams, admissions, career paths)
- Insights:
 - Placement trends
 - ROI comparisons
 - Cutoff analysis
- SEO entry → product experience flow

👉 Content should:

lead to decisions, not just traffic

5. ⚖️ Comparison Experience

Design:

- Side-by-side college comparison
- Highlight **key differences clearly**
- Help users eliminate options faster

👉 This should feel like a **decision tool, not a table**

6. 🎯 Personalization & Intent

Based on:

- Exam scores
- Preferences
- Behavior

Design:

- Smart recommendations
 - “Best colleges for YOU” layer
 - Adaptive homepage
-

7. ⚠️ Edge Cases (Important)

Design for:

- Low or missing data
- Conflicting reviews
- Fake / biased content

👉 Show how your system **handles uncertainty**

8. 🏗️ System Thinking

Show:

- Reusable components
 - Scalable data structure
 - Content + data integration
-

📱 Mobile First + 💻 Web

This is critical.

Mobile:

- Primary usage device
- Fast, swipeable, visual

Web:

- Deep research, comparison, exploration

👉 Show **real UX differences**, not just responsive layouts.

✨ Make It the Coolest Product in This Space

You are expected to push this far beyond current products.

Ideas (optional direction):

- “What college should I choose?” assistant
 - Visual career outcomes
 - ROI-first decision tools
 - Real student journeys
 - Clean, minimal UI vs cluttered portals
-

📦 Deliverables

1. 🎨 Figma File (Mandatory)

- Live link
 - End-to-end flows
 - Core screens + components
-

2. 📝 1-Page Writeup

Include:

- Your product vision
 - Key UX improvements
 - What makes this product “cool”
 - How you improved trust + decision-making
-

🧪 Evaluation Criteria

We are evaluating:

- **Product thinking** → clarity of decisions
- **UX depth** → simplicity in complexity
- **Trust design** → credibility systems
- **Data + content balance**
- **Taste** → does it feel premium?

Avoid

- SEO-heavy cluttered pages
- Copying existing designs
- Too many features, no clarity
- Fancy UI without product depth

Final Bar

If a student uses your product,
they should feel:

“I finally understand which college to choose.”

And if we compare it to existing platforms:

It should feel 10x cleaner, smarter, and more trustworthy.

If you want, I can next:

- Build a **top 1% sample IA + flow**
- Or define **exact scoring rubric for hiring decisions**
